

International Baccalaureate Higher Level Biology:

1. Google Classroom Code: **6ew2r75**

2. Pacing (2 years)

3. Summer assignments:

a. Reading and understanding will help you, as this class is an extremely fast pace class

I. Read Topics 1.1, 1.2 and 1.3 in the IB books

II. Read Topic 2, 3, 4 and 5 in the AP book (much easier to follow, although more pages)

III. Be able to draw and identify the following molecules:

a. Alpha glucose

b. Beta Glucose

c. Ribose

d. Deoxyribose

e. glycerol

f. saturated fatty acid

g. monounsaturated fatty acid

h. Polyunsaturated fatty acid

i. ATP

j. Functional Groups

1. Hydroxyl

2. Amine (amino)

3. Carboxyl

4. Phosphate

5. Carbonyl

h. What two monosaccharides make up the following disaccharides

1. Maltose

2. Lactose

3. Sucrose

i. Draw, label and explain a single amino acid

j. Difference between a condensation reaction (dehydration synthesis) and Hydrolysis

k. Draw the formation of a dipeptide

l. Draw the formation of a triglyceride

m. Draw the formation of a dinucleotide

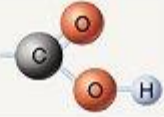

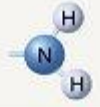

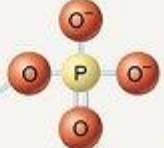

o. Draw a nucleotide

p. Identify the two purines

q. Identify the three pyrimidines

***** By doing this over the summer, it will tremendously help you eventually understand the material come your ENTIRE time in HL Biology. There is not a test or anything to turn in the first day of class, but usually there will be a test the second week of class!

Below are some diagrams that may help you!

Group	Structural Formula	Ball-and-Stick Model	Found In
Hydroxyl	—OH		Carbohydrates
Carbonyl	>C=O		Lipids
Carboxyl	—C(=O)OH		Proteins
Amino	—N(H)2		Proteins
Phosphate	—O—P(=O)(O^-)2		DNA, ATP

Disaccharide Formation and Structure

- Disaccharides are formed when two monosaccharides are joined by dehydration synthesis reaction.

(a) Dehydration synthesis of maltose

(b) Dehydration synthesis of sucrose

Copyright © Pearson Education, Inc., publishing as Benjamin Cummings.

Amylose: α -(1 \rightarrow 4)-glucan; average $n = \text{ca. } 1000$. The linear molecule may carry a few occasional moderately long chains linked α -(1 \rightarrow 6).

Amylopectin: α -(1 \rightarrow 6) branching points. For exterior chains $a = \text{ca. } 12-23$. For interior chains $b = \text{ca. } 20 - 30$. Both a and b vary according to the botanical origin.

Purines

Pyrimidines

Adenosine triphosphate (ATP)

DIFFERENCES BETWEEN CATABOLISM AND ANABOLISM

CATABOLISM

CATABOLISM IS THE SET OF METABOLIC PATHWAYS THAT BREAKS DOWN MOLECULES INTO SMALLER UNITS THAT ARE EITHER OXIDIZED TO RELEASE ENERGY OR USED IN OTHER ANABOLIC REACTIONS.

ANABOLISM

ANABOLISM IS THE SET OF METABOLIC PATHWAYS THAT CONSTRUCT MOLECULES FROM SMALLER UNITS, THESE REACTIONS REQUIRE ENERGY, KNOWN ALSO AS AN ENDERGONIC PROCESS.

Anabolic examples

DNA synthesis

Protein Synthesis

Formation of a larger sugar (mono to di or poly)

Steroids

PHOTOSYNTHESIS

Formation of a dipeptide

ATP Synthesis

Carbon Fixation (light independent) CO₂ to first stable sugar molecule

Catabolic

Digestive system

ANABOLISM VERSUS CATABOLISM

Anabolism is the metabolic process where simple substances are synthesized into complex molecules

Constructive phase of metabolism

Requires ATP energy

Endergonic reaction

Estrogen, testosterone, growth hormone, insulin, etc. are involved

Does not utilize oxygen

Functional at resting or sleeping

Kinetic energy is converted into potential energy

Occurs during photosynthesis in plants, protein synthesis, glycogen synthesis and assimilation in animals

Catabolism is the metabolic process which breaks down large molecules into smaller molecules

Destructive phase of metabolism

Releases ATP energy

Exergonic reaction

Adrenaline, cortisol, glucagon, cytokines, etc. are involved

Utilizes oxygen

Functional at body activities

Potential energy is converted into kinetic energy

Occurs during cellular respiration, digestion, and excretion

DEHYDRATION SYNTHESIS

Dehydration reaction

Dehydration reaction
a form of biochemical reaction wherein water molecule forms as a byproduct.

THE DEHYDRATION SYNTHESIS OF SUCROSE - WHERE GLUCOSE AND FRUCTOSE COMBINE AND WATER MOLECULE IS RELEASED.

Carbohydrates

General molecular formula: $C_n H_{2n} O_n$
1 : 2 : 1

When we say macromolecules what does that mean?
It means huge molecular mass (hundreds or thousands of units joined together to form one huge molecule)

What is a Monomer?
Is the individual unit of a long chain, that keeps repeating
e.g.: glucose

What is a Polymer?
Is a long chain of repeated units (monomers)
e.g.: Amylose

3. Simple carbohydrates (monosaccharides) have the general formula $(\text{CH}_2\text{O})_n$ (hydrates of carbons). Glucose has the formula $\text{C}_6\text{H}_{12}\text{O}_6$ and the Fischer projection (open chain form) and Haworth projection (cyclic, hemiacetal form in solution) are shown below.

a. Propose a mechanism (draw arrows) for the formation of the hemiacetal form (right) of glucose from the open chain form (left).

b. Identify the new chiral center formed in the Haworth projection (right structure).

Definition - Carbohydrates are sugar polymers
 Carbohydrate = Carbon + Water

Fatty acids

- They all have a carboxyl group (-COOH) at one end and a methyl group (CH₃-) at the other end.
- A fatty acid has the general formula: **CH₃-(CH₂)_n-COOH** where n is typically an even number between 12 and 22
- If no double bonds are present the molecule is called a **saturated fatty acid**.
- If a chain contains double bonds, it is called an **unsaturated fatty acid**.

cis fatty acid

trans fatty acid
